Explorations and Lessons Learned in Building an Autonomous FormulaSAE Car from Simulations

Developing a self-driving algorithm in simulation, followed by deployment on a real car. The environment is Formula Student Driverless competition, in which a formula race car, designed and built by students, is challenged to drive through previously unseen tracks that are marked by traffic cones. The project consists of creation of simulation, usage of simulations to train and validate the software stack and the deployment of the system in real-world.

Joint work with Tom Hirshberg, Amir Biran, Dr. Kira Radinsky and Dr. Ashish Kapoor.

Paper: <https://arxiv.org/abs/1905.05940>

Video: <https://youtu.be/2wHz6Jp8IVk>

Images taken from the simulated environment (bottom) and from real tracks (top).

Publication

Published as a conference paper and won best poster award in SIMULTECH 2019. In addition, the project won the Technion computer science department's annual excellent project competition.

Beholder-GAN: Generation and Beautification of Facial Images with Conditioning on Their Beauty Level

Training a generative model to generate faces conditioned on a requested beauty score, and show how this trained generator can be used to "beautify" an input face image. By doing so, an unsupervised beautification model is proposed, in the sense that it relies on no ground truth target images.

Joint work with Nir Diamant, Chaim Baskin, Eli Schwartz and Prof. Alex Bronstein.

Paper: <https://arxiv.org/abs/1902.02593>

Beautification of real faces - Left column are the input real faces, and to the right are the beautified images with an increasing beauty level.

Publication

Published as a conference paper in ICIP 2019. In addition, the project won the best undergraduate project award at IMVC 2019 (Israel's annual computer vision conference).

Affect-based Intrinsic Rewards for Learning General Representations

This work is on an exploration policy achieved using a proposed reward mechanism. The reward function in this work is trained on spontaneous smile behavior that captures positive affect. We trained several downstream computer vision tasks on data collected with our policy and several baseline methods, and show that the policy based on intrinsic affective rewards successfully increases the duration of episodes, area explored and reduces collisions.

Joint work with Dr. Daniel McDuff and Dr. Ashish Kapoor.

Paper: <https://arxiv.org/abs/1912.00403>

A video will be uploaded soon to youtube under the aforementioned project name.

We use the policy to collect data for self-supervised pre-training and then use the learned representations for multiple downstream computer vision tasks.

Publication

Submitted as a conference paper to CVPR 2020.
